I have set up a series of work sessions to receive input on the methods we are proposing to use to analyze impacts in the eis/eir as well as to help refine actions/components. The sessions will be 3-hours in length and cover 5 areas; water supply, water quality, riverine species, delta species and economics. The first two water supply and water quality will have duplicate sessions because we have so many technical experts identified for those two. The dates are June 18 to June 21. More to come on which session is held when and where. Please keep these in mind when planning your future.
